NOTE: This is a 'working draft' sequence. It currently consists of 18 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 49 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a "working draft' sequence It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                      The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alpha region (UTR). Coding sequence, and a growth hormone 3'-untranslated region (UTR). Sequences AAZ40412 and AAZ40413 represent synthetic 5' and 3' splice donor and acceptor sites respectively for generating a synthetic intron to be inserted into the plasmid of the invention. The plasmids can be used for treating a mammalian condition or disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Constructs for expression of interleukin-12 sub-units - are used for delivery of IL-12 sub-units for treating e.g. asthma, microbial

ö
The synthetic intron was designed for highly efficient and accurate RNA splicing. The intron was used in the plasmid pIN0773 which can provide for efficient expression of IL-12 subunits. The products can be used for the treatment of asthma, microbial and viral infections and certain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             an

This sequence represents the plasmid pIF0921 which contains the human interferon alpha (IFN-a) gene. The plasmids can be used for treating a mammalian condition or disease, particularly cancer.
intron was designed for effective RNA splicing and increased gene expression. The plasmids can be used for (in vivo) transfection of a cell in situ in order to modulate tumnour activity. Anti-anglogenic gene inhibits growth of solid tumnour and lung metastatic tumnours by intravenous or intramuscular delivery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New plasmids containing an interferon-alpha coding sequence, used for the treatment of a mammalian condition or disease, particularly cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alpha (IFN-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). This sequence represents the plasmid pIF0921 which contains the human interferon alpha (IFN-a) gene. The plasmids can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                The present sequence is that of expression plasmid pIF0921, which encodes human interferon-alpha (IFN-alpha). The IFN-alpha coding sequence was inserted into the Valentis plasmid backbone containing a 107 bp 5' untranslated region, a 117 bp synthetic intron, the human growth hormone polyadenylation signal, a pUC12 origin of replication and a kanamycin resistance gene, such that the replication and a kanamycin resistance gene, such that the IFN-alpha gene was driven by the cytomegalovirus enhancer/promoter. The resulting plasmid, pIF0921, was formulated with poly-L-glutamate to produce a gene dellavery vehicle, which was intranuscularly injected into mice; both legs were electroporated with caliper to produce a gene dellavery vehicle, which was intranuscularly injected into mice; both legs were electroporated with caliper expression in CD-I mice was observed. This is an example of a method designed for non-viral plasmid-based gene therapy. In this method colymer, such as (biodegradable) poly-L-glutamate, which enhances transfection of the nucleic acid into muscle or tumour tissues, with or without electroporation, and which also stabilises the nucleic acid during storage. The formulation and treatment of muscle and infections In the case of deficiencies, as well as cancer and infections In the case of

Nucleic acid formulation for gene delivery to a muscle or tumour tissue to treat cancer, or infectious disease in a mammal, comprises a nucleic acid and non-encapsulating anionic polymer such as poly-L-glutamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is that of expression plasmid pFN1645, which encodes human Factor IX (FIX). The plasmid has a codon optimised sequence which may be preferred to the natural FIX nucleic acid sequence (in plasmid pFN0945, see AAT70086) when higher expression is desired. In experiments with pFN0945, plasmid DNA was formulated with poly-L-glutamate to produce a gene delivery vehicle, which was intramuscularly injected into C57BL/6 mice tibialis, augmented by electroporation. The highest expression of human FIX achieved using this method 280 ng/ml, compared with levels of 160 ng/ml obtained with naked DNA treatment. Expression was dose dependent, and the plasmid was stable and transcriptionally active in muscle for a prolonged period of time. Applicability to large animals (dog) was demonstrated. Some muscle damage was observed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polymer, such as (biodegradable) poly-L-glutamate, which not only enhances transfection of the nucleic acid into muscle or tumour tissues, with or without electroporation, but also stabilises the nucleic acid during storage. The formulations allow for excination and treatment of muscle disorders and serum protein deficiencies, as well as cancer and infections. In the case of FIX gene delivery, it may be used to treat haemophilia B.
                                                                                                                                                                                                                                                                                                                                                                                                                             Plasmid pFN1645; Factor IX; coagulation; blood clotting; human; gene delivery; haemophilia B; gene therapy; vaccine; codon usage;
                                                                                                                                                                                                                                                                                                                                                                                 Codon optimised plasmid pFN1645 for human coagulation Factor IX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     I mth after treatment. This is an example of the method of the invention for non-viral plasmid-based gene therapy. In this mer a nucleic acid is formulated with a non-encapsulating anionic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Smith LC, Nicol F, Rolland A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            15Her
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  to treat cancer, or infectious disease in a mammal, comprises a nucleic acid and non-encapsulating anionic polymer such as poly-L-glutamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid formulation for gene delivery to a muscle or tumour tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      encodes mouse erythropoletin (EPO). The IFN-alpha coding sequence was inserted into the Valentis plasmid backbone containing a 107 bp 5' untranslated region, a 117 bp synthetic intron, the human growth hormone polyadenylation signal, a pucil origin of replication and a kanamycin resistance gene, such that the EPO gene was driven by the cytomogalovirus enhancer/promoter. The resulting plasmid, pEP1403, was formulated with poly-glutamate to produce a gene delivery vehicle, which was intranscularly injected into mice, under electroporation conditions. Delivery of the plasmid DNA in the poly-glutamate formulation resulted in considerably higher levels of expressed protein than when the plasmid DNA was delivered in saline. This is an example of a method designed for nonviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  electroporation, and which also stabilises the nucleic acid during storage. The formulations allow for vaccination and treatment of muscle disorders and serum protein deficiencies, as well as cancer and infections. In the case of EPO gene delivery, it may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of expression plasmid pEP1403, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   plasmid-based gene therapy. In this method, a nucleic acid is formulated with a non-encapsulating anionic polymer, such as (biodegradable) poly-L-glutamate, which enhances transfection of the nucleic acid into muscle or tumour tissues, with or without
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rolland A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 3609 BP; 811 A; 1031 C; 953 G; 814 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to treat cancer, or infectious disease in a mammal, comprises a nucleic acid and non-encapsulating anionic polymer such as poly-L-glutamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of expression plasmid pFN0945, which encodes human Factor IX (FIX). The plasmid was formulated with encodes human Factor IX (FIX). The plasmid was formulated with encodes human Factor IX (FIX). The plasmid was formulated with encodes of the plasmid was spended the plasmid with ince tibialis, augmented by electroporation. The highest expression of human FIX achieved to sing this method 280 mg/ml, compared with levels of 160 mg/ml obtained with naked DNA treatment. Expression was dose dependent, and the plasmid was stable and transcriptionally active in muscle for a prolonged period of time. Applicability to large animals (dog) was demonstrated. Some muscle damage was observed in the after treatment. This is an example of the method of the invention for non-viral plasmid-based gene therapy. In this method, in muscle and is formulated with a non-encapsulating anionic polymer, such as (biodegradable) poly-L-glutamate, which not only enhances transfection of the nucleic acid into muscle or tumour trissues, with or without electroporation, but also stabilises the nucleic acid during storage. The formulations allow for vaccination and treatment of muscle disorders and serum protein deficiencies, as well as cancer and infections. In the case of
                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In this method,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alpha (Thr-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). This sequence represente plasmid plN1143 which contains the human interleukin 12 (IL-12) gene. The plasmids can be used for treating a mammalian condition or disease, particularly cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plasmids containing an interferon-alpha coding sequence, used for treatment of a mammalian condition or disease, particularly cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    caspase activation; detection; screening; therapy; diagnosis; disease; apoptotic cell death; Fas/APO-1 receptor complex; TNF receptor complex; cancer; follicular lymphoma; carcinoma; p53 mutation; viral infection; hormone-dependent tumour; autoinmune disorder; Alzheimer's disease; systemic lupus erythematosis; immune-mediated glomerulonephritis; stroke; Parkinson's disease; amyotrophic lateral sclerosis; retinitis pigmentosa; spinal muscular dystrophy; cerebellar degeneration; anaemia; drug; cell differentiation; cell survival; CARD-41; CARD-45; CARD-41; CARD-41; CARD-42; human; ds.
                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alpha (IFN-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). This sequence represents the plasmid pIN0961 which contains the mouse interleukin 12 (IL-12) gene. The plasmids can be used for treating a mammalian condition or disease, particularly cancer.
                                                                                                                                                                                                                                                                                       plasmids containing an interferon-alpha coding sequence, used for treatment of a mammalian condition or disease, particularly cancer

This invention describes the isolation of novel human caspase
recruitment domain, CARD-3 and CARD-4 polynucleotides and proteins and a
recruitment domain, CARD-1 protein and genes. The genes and proteins of
the invention are involved in the regulation of caspase activation.
The caspase recruitment domain (CARD) polynucleotides, polypeptides,
the invention are involved in the regulation of caspase activation.

The caspase recruitment domain (CARD) polynucleotides, polypeptides,
the medicine and therapeutic and prophylactic methods of
treatment. The methods may be used to diagnose and treat patients which
assays, predictive medicine and therapeutic and prophylactic methods of
treatment. The methods may be used to diagnose and treat patients which
are suffering from a disorder associated with abnormal level or rate of
apoptotic cell death, abnormal activity of the Fas/APO-1 receptor
complex, abnormal activity of the TWR receptor complex, or abnormal
activity of a caspase. Diseases that may be treated include cancer
complex, abnormal activity of the TWR receptor complex, or abnormal
activity of a caspase. Diseases that may be treated with mutations
con poptotic call leath, abnormal level of electrons
activity of a caspase. Diseases that may be treated with mutations
con fections, Alzheimer's disease, parkinson's disease, amyotrophic lateral
confections, Alzheimer's disease, parkinson's disease, amyotrophic lateral
collectors, retinitis pigmentosa, spinal muscular dystrophy, cerebellar
collectors, retinitis pigmentosa, spinal muscular dystrophy, cerebellar
collectors, retinitis pigmentosa, spinal muscular dystrophy, cerebellar
collectors, anaemia, myelodysplastic syndrome, myocardial infarction,
and cell survival. The CARD proteins may also be used to for screen drugs
con be used for regulation of cellular protliferation and differentiation
con compounds which modulate their activity. The CARD-4 gene can express
con two CARD-4 spilce variants, ashort transcript that encodes
conding region, represented in Figure 3, h

The present sequence is that of CDNA encoding human caspase recruitment domain 4 long form (CARD-4L, see AAB20080). The CDNA was isolated from a human umbilical vein endothelial library using a partial CARD-4S clone as probe. Plasmid pC4L1 containing CARD-4L CDNA is deposited as ATCC 201035. The human CARD-4 gene (see CAR3011) maps to chromosome 7. CARD-4 exists in at least 4 forms, i.e. the long form CARD-4Y (see AAB20082) and CARD-4Z (see AAB20082). CARD-4 (see AAB20082). CARD-4 (see AAB20082) and CARD-4Z (see AAB20082). CARD-4 is an intracellular protein predicted to be involved in regulating caspase activation. It activates the NF-kappaB pathway and enhances caspase 9-mediated cell death. Methods of diagnosing and treating patients suffering from a disorder associated with an abnormal level or rate of apoptotic cell death abnormal activity of the tumour necrosis factor receptor complex, abnormal activity of the tumour necrosis factor receptor complex, candormal activity of a caspase involve administering a compound that modulates the expression or activity of CARD-3, CARD-3, CARD-3, CARD-3, CARD-3, CARD-4, CARD-5 or CARD-6 e.g. a small molecule, antisense nucleic acid, ribozyme or polypeptide. Such disorders include cancer, viral infection, autoimmune disorders, neurological diseases, hemantological called a disorders. Inflammatory disorders and immune disorders. CARD-3 or capper ca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated intracellular proteins predicted to be involved in regulating caspase activation are used for diagnosis and treatment of e.g. cancer, viral infections, autoimmune diseases, neurological diseases and haematological disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to eytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, mamunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                     exon
 AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
csupplement the patients own production of (I). Additionally, (I)
concluded may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic antigen genomic
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54912 to AAK84950 and AAM82169
crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

from Umbellularia californica was used with a modified oligo-dr
from Umbellularia californica was used with a modified oligo-dr
primer with restriction sites for Batta, Bamil, Hindell and Sall,
in PCR amplification of a specific acyl-(ACP)-thioesterase
hybridisation probe ("PCR42") from a wild-type Umbellularia californica
cDNA library. Three cDNA clones, designated ClTE13, CLTE5 and CLTE12,
ceach coding for at least part of a thioesterase with medium-chain
specificity (C10:0-specific) were isolated by screening a Cuphea
lanceolata library with probe PCR42. Then, clone CLTE5 was itself
used as a probe to screen a C.lanceolata genomic DNA library and a
total of 23 clones were identified. Four of the genomic clones were
shown to correspond respectively to PCR42 and the three cDNA clones.
The present sequence is that of the genomic clone designated ClTE91
which corresponds to cDNA clone CLTE12. The binary vector pNBM9-TE91
(DSM 8477) comprising a fragment of ClTE91 is specifically claimed.
The DNA sequences will be useful for transforming oil-producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              An acyl-(ACP)-thio:esterase DNA of medium-chain specificity - isolated from Cuphea lanceolata; for plant transformation to produce Cl0:0 fatty acids, useful in the prodn of eg cosmetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /number= 7

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 13, 1

Sequence 52, Application US/09020956
Patent No. 6261562
GENERAL INFORMATION:
APPLICANT: Dillin, Davin C.
TITLE OF INVENTION: COMPOUNDS FOR IMMUNOTHERAPY OF PROSTATE CANCER AND METHODS NUMBER OF SEQUENCES: 178
COMPRESPONDENCE ADDRESS:
ADDRESSEE: SEED and BERRY LLP
STREET: 6300 Columbia Center, 701 Fifth Avenue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

polylinker; Site_1: Not I; Site_2: Eco RI; The
NH_BNAP_M_S4 library is a subtracted library of a series,
ultimately derived from a mixture of individually tagged
normalized libraries from a mixture of individually tagged
normalized libraries from which ESTs had already been
cerebellum, brain stems, olfactory bulbs, hypothalamus,
cortex, amygdala, basal ganglia, pineal gland, striatum,
hipoccampus) after a series of subtractions to reduce the
representation of cDNAs from which ESTs had already been
generated in this process: NIH_BNAP_M_S4.

CDNA inserts from NIH_BNAP_M_S3.3, NIH_BNAP_M_S3.2, and
NIH_BNAP_M_S3.3, NIH_BNAP_M_S3.3, and MIH_BNAP_M_S3.2, and NIH_BNAP_M_S3.3, and driver in a hybridization with a pool of
the NIH_BNAP_M_S3.3, NIH_BNAP_M_S3.2, and NIH_BNAP_M_S3.3,
libraries in the form of single-stranded circles. The
remaining single-stranded circles (subtracted library)
was purified by hydroxyapafite column chromatorrabn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized hypothalamus library CDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BNAP cDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP cDNAs whose availability will be considered under appropriate and limited collaborative arrangements PoLYA-Yes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Does up of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/folloroform, and separated from free linkers by Centricon 100. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The CDNAs were digested with Sal1 and Not1 enzymes and cloned into Sal1/Not1 site of pSPORT1 plasmid vector. The DH10B E. coli host was transformed with the ligation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note-"Vector: pSPORTI (Invitrogen); Site_1: SalI; Site_2: Motis Mouse cDNA project by the Laboratory of Genetics. National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgsun.grc.nla.nlh.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total RNAS were extracted from a pool of 20 Blastocysts. Double-stranded cDNAs were synthesized with an Oligo(dT) primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;
